# Experimental Setup

# Experiment – Hypothesized result

# Experiment – Hypothesized results

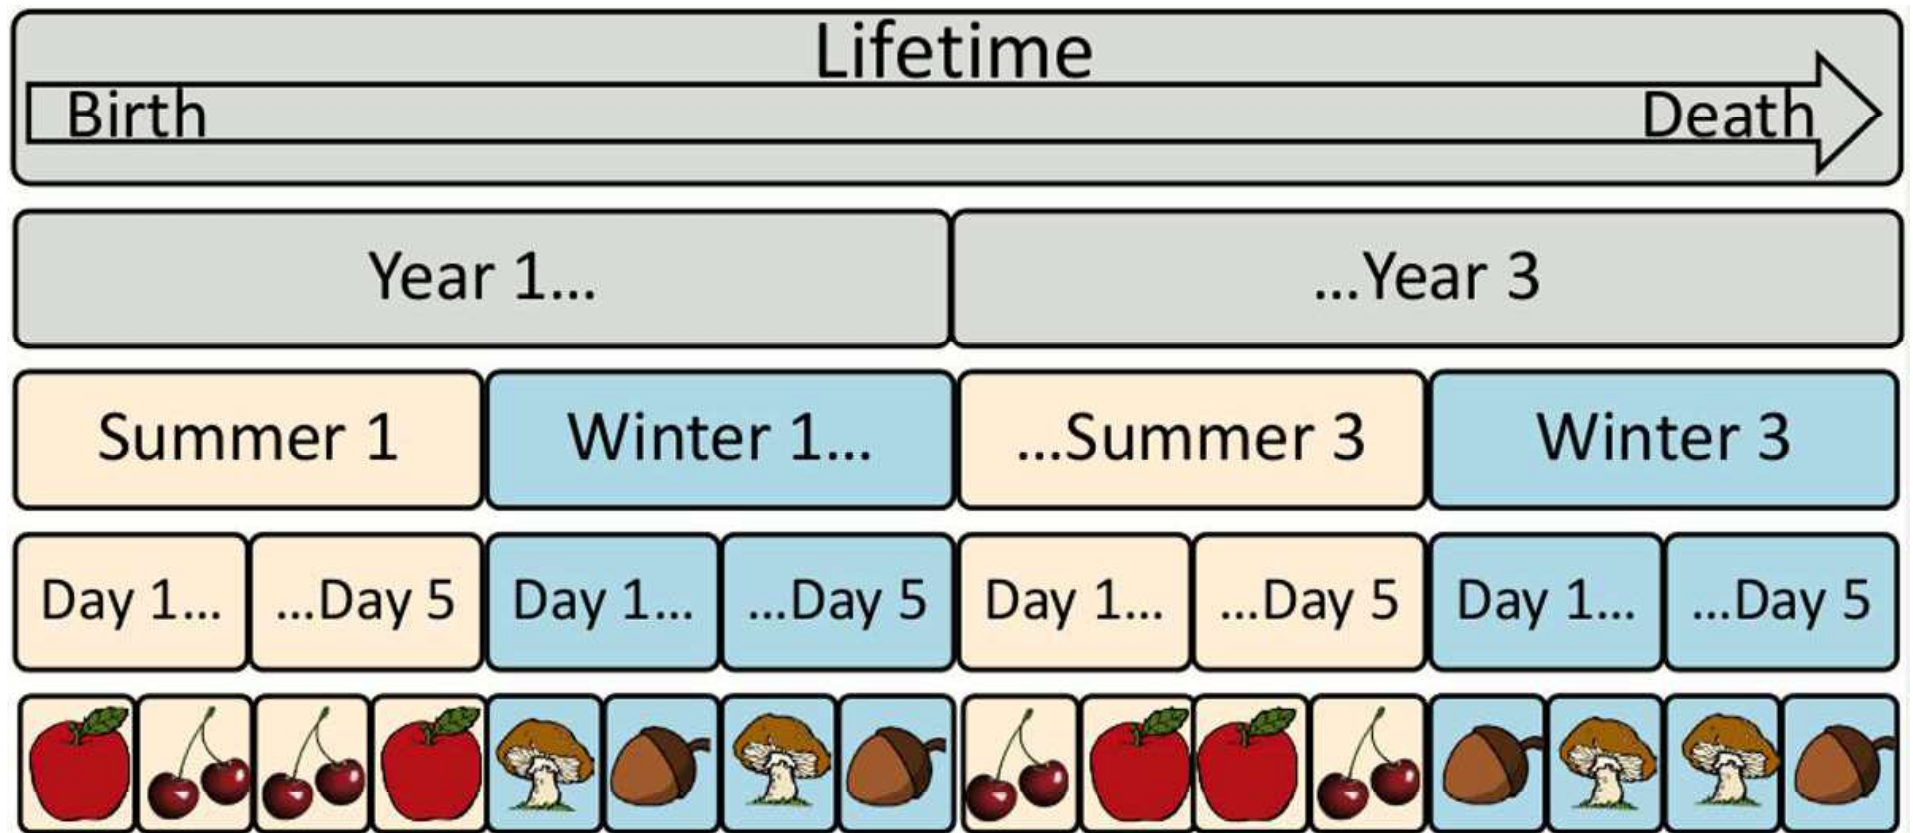

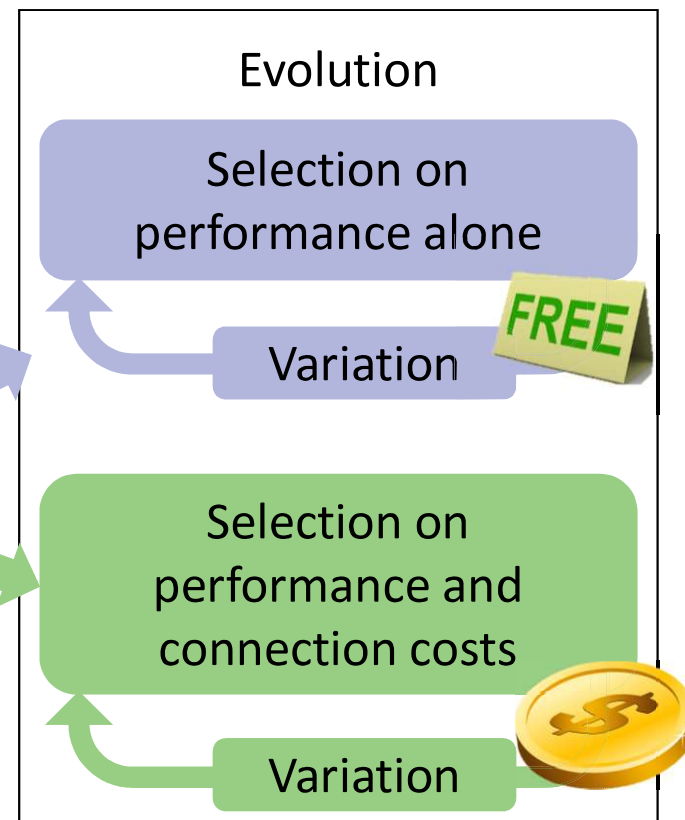

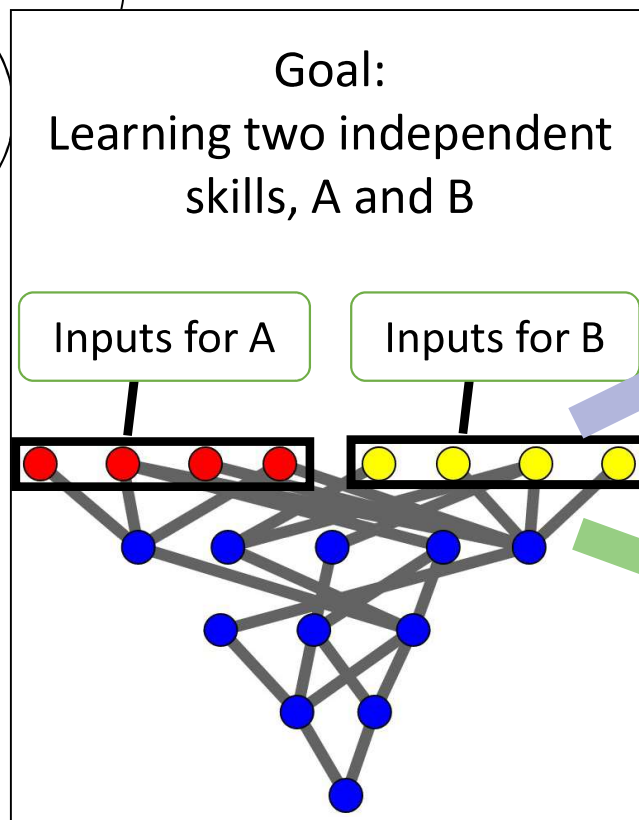

# Evolving Learning Abilities

- Evolution optimized *learning neural networks*
- Each individual was subjected to a number of learning episodes, and awarded a fitness value based on its ability to learn without forgetting
- The learning task abstracted an animal learning food preferences in a seasonally varying environment

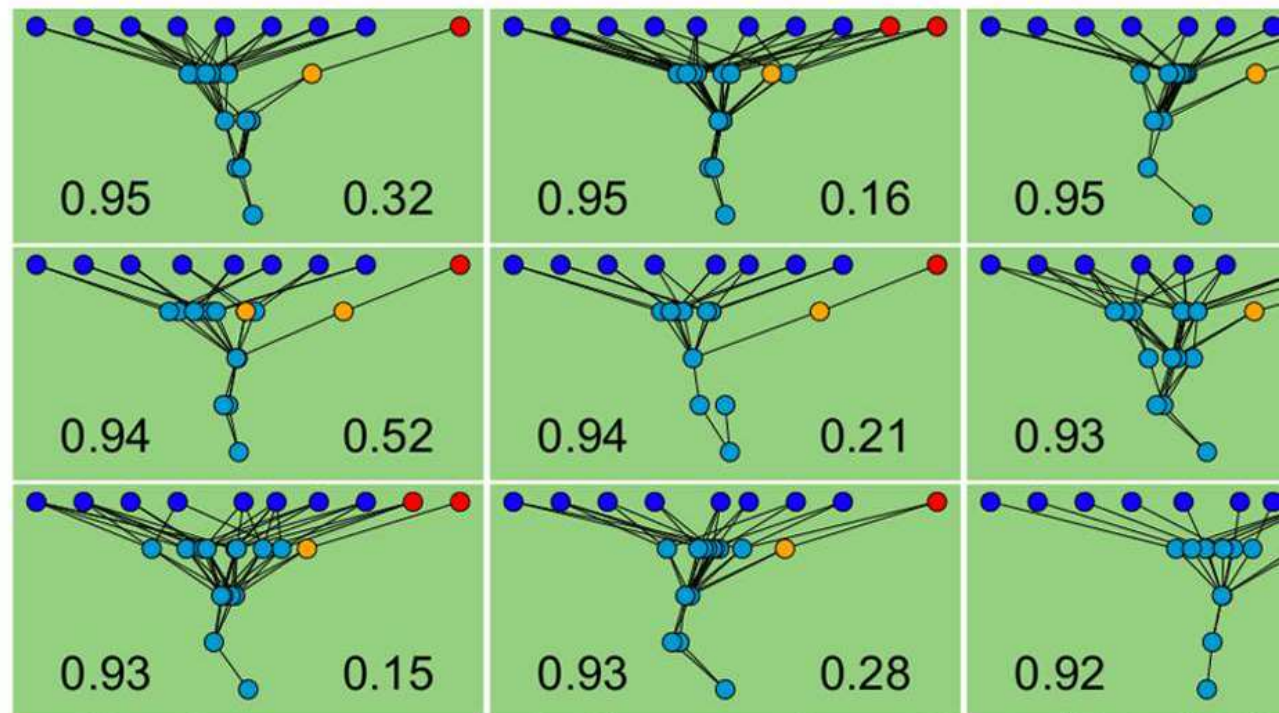

# A Single Fitness Test

Performance Alone (PA)

Performance and Connection Cost (P&CC)

Performance and Connection Cost (P&CC)

## Two Benefits of Modularity:

Separating Skills  
from Learning Signals

Reducing Interference  
Between Learned Skills

Connection Costs  
Performance Alone

# Conclusion

# Summary

- Sequential learning is an important and difficult challenge for neural networks
- Adding a connection cost during evolution increases modularity and performance on this task
- Connection-cost individuals are better at retaining learned skills

# Important issues for future work

- More complex learning tasks
- Different learning paradigms
- Deeper analyses of the modularity. Is there a functional modularity?
- Separating skills but allowing shared knowledge
